Bold numbers represent inches; metric (mm) shown in parentheses.

Joint opening dimensions (A) are based on minimum and maximum pressured allowed in ASTM D3542.

Minimum depth dimensions (B) include a 0.25 inch (6mm) recess below the roadway surface.

Compression seals are not recommended on skewed angles over 15 degrees. Consult with a D.S. Brown [Sales Representative](#) on joint options for higher skews.

<sup>A</sup> The term “modified” in the table relates to the specimen preparation. The use of the joint seal as the specimen source requires that more plies than specified in either of the modified test procedures be used. Such specimen modification shall be agreed upon between the purchaser and the supplier prior to testing. The hardness test shall be made with the durometer in a durometer stand as recommended in Test Methods D2240.

<sup>B</sup> Sample prepared in accordance with Method A of Test Method D518.

<sup>C</sup> Cracking, splitting or sticking of a specimen during a recovery test shall mean that the specimen has failed the test.

<sup>D</sup> The reference section and subsections are those of specification *D 3542 – 08 Preformed Polychloroprene Elastomeric Joint Seals for Bridges*.

<sup>E</sup> Speed of testing shall be 0.5 ± 0.05 in. (13 ± 1.3 mm), minimum at room temperature of 73°F ± 4°F (23 ± 2.2°C). The sheets of sandpaper are not used.
